Certificate

about the cosmetic product

Semilac Extend Base

Clinical application study under dermatological control

The test product was applied twice onto the fingernails of 20 subjects during a period of four weeks. From the clinical-dermatological point of view, no relevant skin reactions occurred in the test area; the product was tolerated

very well.

Neither intolerance reactions suggestive of irritation nor allergic reactions (contact dermatitis) were detected. Accordingly, from the dermatological viewpoint, there is no high potential for irritation and sensitisation for the tested product when this is used as intended.
